

THE TIME FACTOR

S&P ASX 200

Successful Forecast: Nominating the yearly low in 2001 – to the exact day.

SEPTEMBER . 2001

“We are approaching a critical ‘time’ in the Australian market. My research indicates that **a major low is due in the month of September...**”

- *Written forecast: 6 Sep 2001*

“...it would be wise to watch around
the **22-25 of September for the low.**

... if we assume that history repeats
itself... **11 Sept, 2001 is a date to be
wary of.”**

- *Written forecast: 6 Sep 2001*

Successfully forecasting the yearly low in 2001

On 6 September 2001, I successfully forecast (to the exact day) the date of the yearly low reached in the benchmark Australian stock index.

I also forewarned of the volatility I expected to occur on or around September 11, 2001, describing it as a 'date to be wary of'.

I shared this forecast with friends and colleagues, in writing, together with a number of my time calculations behind this forecast. All of this, before the event.

My analysis of market cycles and the research I had conducted all pointed to the month of September 2001 being an important time in global financial markets.

In **Trading with the Time Factor** I explain many of the techniques that were used to enable me to make this forecast and how you too can apply these to your own investment analysis and research.

Forecasting major stock market lows... years in advance

In that same letter to colleagues, I also nominated that 16 November 2003 would be a date to watch for a significant change in trend.

Almost two years later, the Australian stock market made a significant low on 18 November 2003, before moving on to all time record highs (see next page).

By understanding the Time Factor and how to apply this into my market analysis, I was able to nominate this date years before it happened.
